RTR Appendix

Southern California Edison, Pacific Gas and Electric, Southern California Gas, and San Diego Gas and Electric ("Joint Utilities" or "Joint IOUs") developed Responses to Recommendations (RTR) contained in the evaluation studies of the 2013-2015 Energy Efficiency Program Cycle. This Appendix contains the Responses to Recommendations in the report:

RTR for the 2015 Custom Impact Evaluation Industrial, Agricultural, and Large Commercial (Itron, Calmac ID #CPU0154.01, ED WO #ED_I_IALC_5)

The RTR reports demonstrate the Joint Utilities' plans and activities to incorporate EM&V evaluation recommendations into programs to improve performance and operations, where applicable. The Joint IOUs' approach is consistent with the 2013-2016 Energy Division-Investor Owned Utility Energy Efficiency Evaluation, Measurement and Verification (EM&V) Plan¹ and CPUC Decision (D.) 07-09-043².

Individual RTR reports consist of a spreadsheet for each evaluation study. Recommendations were copied verbatim from each evaluation's "Recommendations" section.³ In cases where reports do not contain a section for recommendations, the Joint IOUs attempted to identify recommendations contained within the evaluation. Responses to the recommendations were made on a statewide basis when possible, and when that was not appropriate (e.g., due to utility-specific recommendations), the Joint IOUs responded individually and clearly indicated the authorship of the response.

The Joint IOUs are proud of this opportunity to publicly demonstrate how programs are taking advantage of evaluation recommendations, while providing transparency to stakeholders on the "positive feedback loop" between program design, implementation, and evaluation. This feedback loop can also provide guidance to the evaluation community on the types and structure of recommendations that are most relevant and helpful to program managers. The Joint IOUs believe this feedback will help improve both programs and future evaluation reports.

Page 336, "Within 60 days of public release of a final report, the program administrators will respond in writing to the final report findings and recommendations indicating what action, if any, will be taken as a result of study findings. The IOU responses will be posted on the public document website." The Plan is available at http://www.energydataweb.com/cpuc.

Attachment 7, page 4, "Within 60 days of public release, program administrators will respond in writing to the final report findings and recommendations indicating what action, if any, will be taken as a result of study findings as they relate to potential changes to the programs. Energy Division can choose to extend the 60 day limit if the administrator presents a compelling case that more time is needed and the delay will not cause any problems in the implementation schedule, and may shorten the time on a case-by-case basis if necessary to avoid delays in the schedule."

Recommendations may have also been made to the CPUC, the CEC, and evaluators. Responses to these recommendations will be made by Energy Division at a later time and posted separately.

Response to Recommendations (RTR) in Impact, Process, and Market Assessment Studies

Study Title:	2015 Custom Impact Evaluation Industrial, Agricultural, and Large Commercial
Program:	IALC
Author:	ltron
Calmac ID:	CPU0154.01

1	7.1.1	Out of 148 M&V points, 30 projects, or 20 per- cent of the sample, had a GRR of zero or lower.	PAs should improve pro- gram eligibility require- ments, manuals, training, and quality control proce- dures in order to screen out ineligible projects. A more thorough PA review of ex-ante documentation for eligibility and program rules is needed. Screen- ing should focus on the following issues identified in Chapter 4: improved attention to ISP determi- nations and their effec- tive dates, assurance that impacts are realized on the grid where on-site generation is present, re- moval of projects that in- volve like-for-like replace- ments, and demonstra- tion that qualifying pro- gram measures exceed code-based energy effi- ciency requirements as-	If incorrect, please indicate and redirect in notes. All IOUs	Choose: Accepted, Rejected, or Other Accepted	Examples: Describe specific program change, give reason for rejection, or indicate that it's under further review. In 2015, the Custom Implementation Team (CIT) was formed. It was de- signed to systematically review cus- tom projects based on pre-selected criteria to ensure quality, consistency and adherence to PG&E and CPUC guidelines. CIT began to develop a method of pre-review work early in 2016 to screen for eligibility, influ- ence, measure classification and baselines. In late 2016, CIT imple- mented a pre-review of all (except MLC, DI) Custom projects screening for eligibility, influence, measure clas- sification and baselines.	Choose: Accepted, Rejected, or Other Accepted	Examples: Describe specific program change, give reason for rejection, or indicate that it's under further review. As of 2016 we have a pre-screen checklist in place which ensures pro- ject compliance to these factors.	Choose: Accepted, ejected, or Other Accepted	Examples: Describe specific program change, give reason for rejection, or indicate that it's under further review. SoCalGas strives to improve its eligi- bility documentation and plans to re- visit its documentation, specifically its eligibility questionnaire and project history form that was developed in October 2014. Starting in Q1 2017, SoCalGas updated its training materi- als and hosted training that covers how to screen out ineligible projects. SoCalGas continuously improves its screening of eligible projects by apply- ing filters to its application process. SoCalGas has increased project scru- tiny by pulling in all stakeholders to examine and inform project develop- ment early in the process. SoCalGas also has a pre-application audit with its customer where SoCalGas visits the customer sites to verify energy savings and encourages the customer to participate in the highest energy savings projects. For on-site generation, SoCalGas' eli- gibility questionnaire identifies sites with on-site generation. For those	Choose: Accepted, Rejected, or Other Accepted	Examples: Describe specific program change, give reason for rejection, or indicate that it's under further review. SDGE since 2016 has improved its project validation review procedures through the process of assigning the project to an internal SDGE Engineer to more thoroughly review the per- spective custom project. Additionally by August of 2017 SDGE will be imple- menting a new Engineering project database which will improve the engi- neering review process from the as- signed project engineer and the qual- ity control engineer.
			sociated with original construction or subse- quent upgrades.							sites, SoCalGas has an in-depth pro- gram and engineering review process to determine the qualifying fuel is be- ing saved. Also, the Track 2 Working Group		

									(T2WG) is developing preponderance of evidence requirements for program influence and ER baseline determina- tion. SoCalGas will adjust program policies and procedures accordingly.		
2	7.1.1	Regarding eligibility, the PAs should clearly docu- ment the energy effi- ciency action that is being performed and ensure that program rules are followed. Projects should have an identifiable and documented case for en- ergy efficiency claims and application documenta- tion should adequately explain how a given pro- ject saves energy.	All IOUs	Accepted	In 2017, CIT is planning to create a common technical reviewer pre/post installation template that addresses, among other things, customer documentation and evidence for eligibility of each measure. CIT will be reviewing template worksheet from the Final Site Report entitled "Project Eligibility." Using this template ensures that PG&E is looking at the same criteria as CPUC/ED.	Accepted	As of 2017, all projects utilize a pro- ject feasibility study which requires this information.	Accepted	SoCalGas' projects are vetted at sev- eral points in the process and docu- mentation is based on the normal se- quence of the project.	Accepted	All projects must meet program crite- ria prior to being assigned to an inter- nal SDGE engineer. Additionally SDGE engineering will be implementing a new project engineering database software in August of 2017 which will institute additional project scrutiny by the assigned engineer and the quality control engineer to more thoroughly detail how a project saves energy.
3	7.1.1	PAs should screen measures for eligibility, including removal of maintenance measures and assurance that pro- jects meet program eligi- bility performance thresholds.	All IOUs	Accepted	In late 2016, CIT has implemented a pre-review of all (except MLC, DI) Cus- tom projects screening for eligibility, Influence, measure classification and baselines.	Accepted	As of 2017 we pre-screen all calcu- lated projects during which field engi- neering validates this information.	Other	This recommendation is not applica- ble. Based on D.16-08-019, mainte- nance measures will become eligible for energy savings under the Behav- ioral, Retrocommissioning and Opera- tional (<i>BRO</i>) baseline.	Accepted	The assigned internal SDGE project engineer itemizes primary drivers for EE projects and the repairs are a re- viewed checked item within our Free rider screening form.
4	7.1.1	The PAs should adjust the set of qualifying measures/technologies that are eligible for incen- tives and annually review the list of qualifying measures for each pro- gram to eliminate eligibil- ity for those that became standard practice.	All IOUs	Accepted	In 2017, CIT is updating our eligible measures on PG&E's internal Wiki site. We have started to grow eligible measures during our pre-review of Custom projects.	Accepted	A technical meeting has been in place that looks at measure management and eligibility on a weekly basis.	Accepted	SoCalGas seeks to actively promote technologies that are less-adopted, cutting edge, or emerging technolo- gies. SoCalGas is working with Statewide partners to identify ISP measures collaboratively with Codes & Standards. ISP is currently a topic in T2WG, and SoCalGas will implement direction which emerges from that forum.	Accepted	The list of Industry Standard Practice studies is maintained on the Non- DEER CMPA website. SDGE engineer- ing references the ISP list to update them for potential measures that would be recognized as ISP measures.
5	7.1.1	The PAs should carefully review each of the 30 FSRs listed in Section 4.4.2, Table 4-6, to iden- tify the specific reasons that led to zero or nega- tive savings, and use those lessons learned to improve related project practices. An array of dif- ferent factors led to very low site-level GRRs, but some common reasons include: like-for-like re- placement of equipment, improper application of ISP, improper application or interpretation of code requirements, baseline	All IOUs	Accepted	In 2017, CIT has provided Ex-Post training to our Implementers, tech- nical reviewers, and internal engi- neers on the lessons learned from the 2015 Ex Post evaluation. CIT & ATS as well as key stakeholders were in- volved in in-depth review and meet- ing with the CPUP-ED and their 2015 IALC custom impact evaluation con- sultants to discuss the zero saver pro- jects. In-depth review will eventually cover all 42 FSRs, as there are lessons to be learned in all. There were only 9 zero savers in PG&Eand unfortu- nately we do not have access to the other IOUs Zero Savers. We suggest that we confer with the other IOUs to understand what, if anything, was learned in their reviews of the 2015	Accepted	As of 2017 we pre-screen all calcu- lated projects during which field engi- neering validates this information.	Accepted	As the FSRs are posted, the SoCalGas team reviews it and implements the specific responses as appropriate. Some recommendations will take time before they are fully realized in Ex Post since there is a lag from when an FSR is provided and projects in the ex- isting program pipeline.	Accepted	All custom projects are assigned to in- ternal SDGE engineering staff to re- view and as such the results of 2015 Ex Post evaluation will also be re- viewed for lessons learn to the inter- nal SDGE engineering staff so that they could improve their project re- viewing skill sets.

			the ISP / code baseline. As such, it is important			statewide IUOs' effort in ISP investiga- tions; and d) sharing lessons learned.		1				with the CPUC ExAnte team on a

	that the PAs spend ade- quate time documenting the appropriate project type and project baseline when establishing eligibil- ity. The PAs should exam- ine Appendix F, which in- cludes a list of every pro- ject where the evaluation overturned the PA speci- fied project type or base- line type.		In addition, since 2016 PG&E has added a QC screening of every cus- tom project by the CIT. Finally, the CIT and EE EM&V team will review in- depth the findings in Appendix F of the 2015 IALC report.						weekly basis. Furthermore the recom- mendation of reviewing the Appendix F will also be reviewed by SDGE engi- neers to further update their knowledge based on the ExPost 2015 evaluations.
9	7.1.1 **PAs should push participating customers to higher levels of efficiency in order to build in a savings buffer above ISP/code/non-regressive baselines and thereby have greater assurance of project eligibility and achievement of ex-ante saving claims. All IOUs	Other	PG&E heavily advocates for energy ef- ficiency measures above ISP/code/baseline with its various cus- tomer touchpoints including the use of strategic account managers, energy efficiency marketing campaigns, and 3P vendors who actively recruit cus- tomers for custom projects. PG&E has adopted actions that provide for a) In- centives that improves the cost-effec- tiveness and increases the attractive- ness of the EE option; b) Validation of technical aspects and energy savings by PG&E engineering and its consult- ants; c) Endorsement of vendor claims for the EE option; and d) pro- motion of vendor stocking of more EE equipment and market effects. Im- pact evaluations focus mostly on the effect of the EE monetary incentive as the other impact of the PG&E inter- ventions are harder to assess. This can lead to underestimation of the impact of PG&E's interventions. PG&E EE EM&V team has continuously ad- vocated for a review of the methods used to assess the impact of all the PG&E interventions. We welcome fur- ther collaboration to that effect so that future programs can optimize the mix of their offerings for maximum in- cremental EE uptake by customers.	Accepted	Higher "targeted" incentive category which pays a higher incentive rate to push deeper saving measures. SCE also offers a Comprehensive Bonus for projects with deeper integrated savings across categories.	Accepted	SoCalGas agrees and this recommen- dation is consistent with current SoCalGas' best practice where appli- cable. SoCalGas is updating training procedures to include all implement- ers and consultants who address cus- tom project eligibility. ISP is currently a topic in T2WG, and SoCalGas will implement and train on direction that emerges.	Other	Since 2015 SDGE custom program has restructured its approach by assigning an internal engineer early in the cus- tom project process to facilitate early engagement with the customer, to ensure that the energy efficiency measures discussed for the perspec- tive project have the best potential for deeper energy savings.
10	7.1.2For the majority of pro- jects included in the evaluation gross impact sample the ex-post eval- uation used a different model or adjusted the thermore, the evalua- tors used different in- process. The PAs and try best practices, and PCPUC's ex-ante review tors used different in- process. The PAs and their subcontractors for the majority of pro- jects in the sample. In some cases, the PA did not properly take intoPAs should continue to review and improve im- pet and mod- evaluation results, indus- evaluation results, indus- try best practices, and CPUC's ex-ante review tors used different in- process. The PAs and their subcontractors for the majority of pro- isonul review the meth- ods and models used in some cases, the PA did this evaluation for pro- not properly take intoAll IOUs7.1.2For the majority of pro- jects that were identifiedAll IOUs	Other	PG&E staff has developed a multi- pronged approach to the improve- ment of savings estimation methods and models. Through the develop- ment of a centralized and streamlined review process, projects are screened for pre-selected criteria based on feedback in prior Impact Evaluations and more specifically, Project Devel- opment protocol and trainings to ad- dress the procedural and knowledge gaps related to this issue.	Accepted	A comprehensive training has been developed for delivery channels to address these issues.	Accepted	This recommendation is consistent with current SoCalGas' best practice. SoCalGas continues to work with CPUC's ex ante review process on modeling approaches; SoCalGas also works with the ex post team to pro- vide comments as the process is on- going.	Other	Once again, all projects that are sub- mitted to the custom program within SDGE are reviewed 100% by assigned internal SDGE engineers. In turn when a project has an associated third- party implementer, the project associ- ated to that third-party implementer is submitted to our internal engineers for review and our internal SDGE en- gineer shares ExAnte and ExPost guid- ance with that third-party program participant, thus educating them on the updated CPUC guidance which may have resulted in reduced savings

	account key factors that may impact the savings such as weather/sea- sonality/production nor- malization. Generally, models needed to be adjusted because the PAs did not properly ac- count for CPUC policy and guidance, previous EAR guidance, and standard evaluation practices.	as needing improvements to ex-ante calculation ap- proaches. PAs should continue to improve their modeling approaches through systematic re- view and assessment of approaches developed and used internally, by third parties, by profes- sional organizations, and by programs in other ju- risdictions. CPUC guide- lines should be followed, including the estimation of savings when non-IOU supplied energy sources are used, such as per- forming hourly net grid impact analysis. In addi- tion, the PAs should con- tinue to work closely and collaboratively with the CPUC's ex-ante review process to assess and agree on modeling ap- proaches based on the results of ex-post evalua- tion and ongoing ex-ante review. The evaluation team rec- ommends that the PAs provide their implement- ers and/or customers with the most current, standardized or CPUC-ap- proved calculation tools. Calculations should be developed using proven tools.	All IOUs	Accepted	PG&E is utilizing a media Wiki system to help organize the approved stand- ard tools and communicate correct tools and versions. For example, when "Steam Trap" is searched, the page for the steam trap tool will pop up. The page contains the SoCalGas ap- proved steam trap tool will pop up. The page contains the SoCalGas ap- proved steam trap tool, the disposi- tions, and notes on the measure sun- set schedules. In Q2 2016, PG&E also created a Standard Calculations and Tools Committee, which is broken into 9 groups; Boilers/Steam Generators, Compressed Air, Data Centers, HVAC, Lighting, Petroleum, Pumping Sys- tems, Refrigeration, and Wa- ter/Wastewater Treatment. Each	Accepted	All approved tools are listed in SCE Calculated Guidelines and/or are inte- grated into SCE's online application tool.	Accepted	This recommendation is consistent with current SoCalGas' best practice. Every 3-5 years, SoCalGas has per- formed a tools review and ensures implementers are aware of the cur- rent tool location.	Accepted	for the projects they are submitting. Most importantly to the updating and re-educating process is that our inter- nal SDGE engineers are actively moni- toring and applying revisions to the projects that are submitted to the custom program under the basis of updated and current direction of the CPUC ExAnte and ExPost commission departments. SDGE continues to offer workshops at our Energy Innovation Center on "Tools and Tips for Estimating Energy Efficiency Seminar" twice per year for contractors/customers/engineers. The workshop discusses common tools used for energy savings evaluation and provides some example calcula- tions. The presentation is continually updated using current analysis tools and procedures.
					ter/Wastewater Treatment. Each group has a lead field engineer and lead ATS engineer assigned who are in charge of identifying needs for addi- tional standardized tools, maintaining existing tools, and ensuring uniform calculation methodology in their seg- ment.						
12 7.1.2		Further, the PAs should include in each applica- tion file the live, un- locked, non-password	All IOUs	Accepted	From Q4 2015-Q3 2016, PG&E CIT verified that calculations were live, and spreadsheets were not locked	Other	This is already a requirement for the SCE program based on the Calculated Guidelines.	Accepted	This recommendation is consistent with current SoCalGas' best practice.	Accepted	SDGE engineers have been providing live and unlocked non-password pro- tected spreadsheet models since Q3 of 2015. We will continue to provide

	protected spreadsheet models. The PAs should ensure the final model is stored in each file and record key model inputs and outputs, docu- mented using data or ob- served conditions.		prior to assigning pre-installation re- view projects to technical reviewers. Now the check is done by the tech- nical reviewers when they begin their review.						the need unlocked models and inputs and outputs for the custom projects that SDGE engineers review.
13 7.1.2	PAs should carefully re- view ex-ante savings claims, inputs, and calcu- lation methods. Ex-ante savings estimates and cal- culation methods should be more thoroughly re- viewed and approved by PA technical staff prior to finalization of incentives and savings claims. These reviews by knowledgea- ble technical staff can help ensure reliable and accurate impact estima- tion.All IOUs	Accepted	PG&E sends all custom projects for pre and post installation review to technical reviewers.	Accepted	SCE has a two-tier technical review on all calculated projects. SCE Field Engi- neering is the first tier, and we have independent third parties that evalu- ate the projects as tier 2.	Accepted	This recommendation is consistent with current SoCalGas' best practice.	Accepted	Custom projects that are incentivized by SDGE are assigned to a separate in- ternal SDGE engineer who is responsi- ble and accountable for the analysis performed on the assigned project. There is also a separate Quality Con- trol senior engineer who reviews the project results that the assigned pro- ject engineer submitted. This process ensures there are checks and bal- ances in the review and is performed on 100% of our custom projects that are incentivized by the program.
14 7.1.2	PAs should conduct peri- odic due diligence to en- sure programs adhere to PA and CPUC impact esti- mation policies, guide- lines, and best practices. Given the multitude of non-utility and utility pro- grams, the PAs should consider interventions such as increased training and project scrutiny to ensure the most accurate savings claims consistent with eligibility, baseline and program rules. In ad- dition, the PAs should continue to work collabo- ratively with the CPUC's ex-ante review process and look for ways to lev- erage lessons learned from that process to im- plement their own inter- nal ex-ante review of third party programs.All IOUs	Accepted	Beginning Q4 2015, CIT began per- forming policy reviews on all pre-in- stallation projects prior to technical review assignment. The eligibility re- view previously focused on rulebook compliance, with a format that ena- bled quickly flagging possible issues for technical reviewers to follow up on. In Q3 2016, reviews expanded in scope by allocating additional time for CIT to push back on project develop- ers on persisting issues of baseline se- lection, measure type, and influence. Review findings are attached in the project files and documented in the Wiki. For example, an industrial wastewater VFD project was rejected during CIT review in Q1 2017, and ad- ditional notes were added in the sec- tion about "SCE's Wastewater Treat- ment Plant Pumps VFD" study high- lighting that industrial customers were included in that study's scope. Project reviews and dispositions are searchable in the wiki and available to PG&E project developers and Tech- nical Reviewers. Third party imple- menters currently do not have wiki access, and the current work around is to send pdf copies of content.	Accepted	SCE has a two-tier technical review on all calculated projects. SCE Field Engi- neering is the first tier, and we have independent third parties that evalu- ate the projects as tier 2.	Accepted	SoCalGas continuously evaluates its calculated program. The results in- form program process improvements. SoCalGas has increased project scru- tiny by pulling in stakeholders to ex- amine and inform project develop- ment throughout the process.	Accepted	As stated in the question above with regard to SDGE's custom engineering practices, the projects that come through the custom programs either originating from self-sponsoring cus- tomers or third-party implementers all get assigned to internal SDGE engi- neers for review and are then vali- dated by a separate SDGE senior qual- ity control engineer to ensure that the projects are reviewed thoroughly and calculated appropriately. The entire SDGE engineering department partici- pates and collaborates with both the Commission ExAnte and ExPost group, in an effort to continual improve and update our engineering practices, this has been the practice since 2015.
15 7.1.2	**The PAs should priori- All IOUs tize M&V reviews for all large projects. Based on	Accepted	CIT provided M&V training in June 2016, outlining Commission staff M&V guidance. In Q4 2016, for larger	Accepted	SCE already has a multi-tiered ap- proach to project rigor depending on size. >100,000kWh already receive full	Accepted	SoCalGas develops M&V plans for all large projects over 200,000 therms. In	Accepted	Since 2016, the number of projects that have associated M&V require- ments to support the savings claim

		the distribution of cus- tom projects by size ob- served in 2015 a census of large projects in strata 1-3 ranges by PA from just a handful or projects to less than 50, and rep- resents roughly 40 to 60 percent of ex-ante sav- ings claims. The purpose would be to ensure that CPUC M&V standards are being met for the treat- ment and documentation of program ex-ante sav- ings. This would reduce risk to ex-ante claims, and should focus on proper baseline documentation, appropriate eligibility screening, CPUC-ap- proved M&V planning and implementation, and the development of ro- bust and accurate savings estimation models and results.			projects (> \$200,000 in incentives), CIT implemented a post-QA/QC re- view which includes M&V checks - in- cluding measurement points, meas- urement period, measurement inter- val, measurement equipment, system diagrams and discussion of measure- ment equipment accuracy & uncer- tainty. CIT policy reviews address baseline selection for all project sizes during pre-installation review.		rigor.		addition, SoCalGas has a tiered Instal- lation Review (IR), which is a meas- urement and verification process for projects saving less than 200,000 therms.		have increased in the custom program offerings. SDGE will continue to sup- port improved M&V requirements for large scale project in an effort to sup- port the projects savings claims.
16	7.1.2	**For certain applica- tions, such as where the baseline is represented by the pre-existing equip- ment and pre- to post- in- stallation conditions are stable, PA use of an IP- MVP Option B or C re- gression model may be preferable to other calcu- lation- based approaches. Regression models should also account for all non-routine adjust- ments, as facilities often undergo changes unre- lated to program effi- ciency-based improve- ments, and savings esti- mates should be normal- ized for production and weather differences. It is also critical that the measure- impacted ac- counts be properly identi- fied and used in regres- sion models. Regressions may serve to better bound the savings and may also be used as a	All IOUs	Accepted	These comments have been added to the PGE wiki page on regressions.	Accepted	As part of the SCE technical review process, when appropriate and neces- sary, it is normal practice to request applicants to normalize regression models for weather and/or produc- tion data. For those projects that uti- lize a statistical model to estimate en- ergy savings impacts, SCE will con- tinue to review the appropriate met- rics to determine the level of uncer- tainty (i.e. an R squared value be 0.7 or greater). The duration of post retrofit data col- lection period are generally tiered by the level of savings and calculation methodology adopted. These periods are typically a PA approved and de- fined based on the nature of the en- ergy efficiency measure (EEM) with durations lasting from a minimum of 1-2 week, for low impact, constant load or low variance measures and up to 2-6 months or a 1 year for high im- pact, variable load, or high variability measures. Interval data is highly dependent on the nature of the EEM and expected variance. When appropriate and nec- essary, daily, hourly and sub-hourly	Accepted	When applicable, SoCalGas prefers to use IPMVP Option A and B for com- mercial and industrial custom pro- jects. SoCalGas typically accounts for non-routine adjustments and assump- tion inaccuracies in our post-installa- tion analysis. SoCalGas often finds Option C difficult to implement in practice for commercial and industrial production facilities due to the addi- tional variable of "need for utilities" at any particular point in time. This is often difficult to account for without customer making capital-intensive in- vestments in measurement infrastruc- ture.	Accepted	These comments have been dissemi- nated to the entire SDGE engineering staff and will be utilized as part of their updated knowledge of operation pertaining to CPUC guidance.

	ical prior to truing-up the									

					collected.						
32	7.1.4	As stated in previous evaluation cycles, the PAs should use longer-term pre- and post-installation M&V activities and true- up the savings estimates to reflect observed meas- ure operation. The PAs should also normalize for production fluctuations (and other variables like weather where applica- ble) between pre- and post-installation periods.	All IOUs	Accepted	PG&E has been requiring longer (>2 weeks) M&V on weather dependent and seasonal projects. The M&V has to be done during a relevant time pe- riod and goes beyond steady operat- ing state. Project developers are re- quired to true-up savings calculations with M&V data.	Accepted/ Other	M&V and trending savings are done at a project size basis. Projects that exceed 100,000kWh receive longer M&V periods and at times are re- quired to receive delayed payments. Due to cost restraints, small projects (less than 25,000kWh) do not receive the same level of scrutiny.	Accepted	SoCalGas develops M&V plans for all large projects over 200,000 therms. In addition, SoCalGas has a tiered Instal- lation Review (IR), which is a meas- urement and verification process for projects saving less than 200,000 therms. SoCalGas accepts this recommenda- tion.	Accepted	SDGE has been requiring longer (>2 weeks) M&V on weather dependent and seasonal projects. The M&V has to be done during relevant time pe- riod and goes beyond steady operat- ing state. Project developers are re- quired to true-up savings calculations with M&V data that is provided as stated in the M&V plan.
		In some cases, PAs should delay claiming energy savings for projects if the installation is not com- plete or if operations are very unstable or unrepre- sentative of expected ex- post conditions. The PAs should also ensure that savings estimates are al- ways updated in the pro- ject documentation and tracking systems when operation conditions are found to have signifi- cantly changed. **Measures such as agri-						Accepted	This recommendation is consistent with current SoCalGas' best practice.		
		cultural pumps require lengthier trend data sources, given that opera- tions can be greatly af- fected by weather, includ- ing drought conditions, and water availability.							with current SoCalGas' best practice.		
33	7.1.4	For projects entailing the use of simulation models, models should be re-run after the equipment is commissioned and build- ing loads represent steady state operation. **For new construction projects associated with either tenant improve- ments or new buildings, PAs should wait to file claims once the project is fully built out and occu- pied. A certificate of oc- cupancy can be used to inform the timing of	All IOUs	Accepted	PG&E fully accepts that savings for all custom projects should be revised at post-installation based on observed conditions, including those that use simulation models. For new construc- tion Savings By Design projects, PG&E currently does adjust, to some de- gree, the simulation models to reflect observed conditions, but this practice may not be consistent across project developers and reviewers. With the SBD program moving to Statewide Ad- ministration, PG&E will recommend to the new Statewide Program Ad- ministrator that a process require- ment be established to ensure that	Other	We do not intend on implementing due to current customer commitment concerns, but we will discuss this pos- sibility as a Statewide level for possi- ble future implementation.	Accepted	This recommendation is consistent with current SoCalGas' best practice. For Non-Residential New Construc- tion, SoCalGas waits to claim energy savings once the project is fully built.	Accepted	SDGE fully accepts that savings for all custom projects should be revised at post-installation based on observed conditions, including those that use simulation models. For new construc- tion Savings By Design projects, SDGE currently does adjust and reconcile the initial building models to account for the observed conditions noted during the inspection.

ISP?				
 Is the project being 				
 Is the project being done primarily, or in 				
part, to comply with				
regulatory mandates				
(such as environmental				
regulations)?				
 Are the project eco- 				
nomics already com-				
pelling without incen-				
tives? Is the rebate				
large enough as a				
share of incremental				
costs to make a differ-				
ence in whether or not				
the project is imple-				
mented?				
 Is the company in a 				
market segment that is				
ahead of the curve on				
energy efficiency tech-				
nology installations? Is				
it part of a national				
chain that already has				

a mandate to install			
the proposed technol-			
ogy?			
Does the proposed			
measure have substan-			
tial non- energy bene-			
fits? Is it largely being			
considered for non-en-			
ergy reasons (such as			
automation of a man-			
ual process, improved			
product quality, re-			
duced labor costs, or			
increased production)?			
 Is there a fungible effi- 			
ciency element of the			
project, that is, is the			
equipment available			
only at a single bun-			
dled efficiency level,			
e.g., as could be the			
case with a highly spe- cialized piece of pro-			
cess equipment? Re- lated to this, if effi-			
ciency level is a mallea-			
ble attribute of the			
project, were the costs			
and benefits of differ-			
ent levels of efficiency			
considered and quanti-			
fied?			
By conducting a brief in-			
terview regarding these			
issues before the incen- tive is approved, the im-			
plementer can better as-			
sess the likely degree of			
free ridership and may be			
able to then decide if the			
project should be ex-			
cluded or substantially re-			
scoped to a higher effi-			
ciency level.			

Whole Building Approach-Calculation Guidelines

By Ryan McFadyen, P.E. and Thomas Lor,

P.E. Updated June 23, 2016

Savings By Design Simulation Protocol Matrix

Savings By Design whole building approach projects require a Title 24 compliance simulation and a specialized non-compliance Savings By Design simulation. Construct the four models according to the Savings By Design protocol matrix. The attributes of the four simulations are outlined in the table below.

	SBD Simulation Protocol Matrix								
	Compliance	e Simulation	Non-Complia	nce Simulation					
	Baseline	Proposed	Baseline	Proposed					
Weather Data	CEC CZ	CEC CZ	CEC CZ	CEC CZ					
HVAC System Type	Per Title 24	Per Plans	Per Title 24	Per Plans/As Built					
Equipment Efficiencies	Per Title 24	Per Plans	Per Title 24	Per Plans/As Built					
Schedules	Per Title 24	Per Title 24	Estimated/Actual	Estimated/Actual					
Artificial Loads*	Per Title 24	Per Title 24	Per Plans	Per Plans/As Built					
LPD in Conditioned Spaces	Per Title 24	Per Plans	Per Title 24	Per Plans/As Built					
Envelope	Per Title 24	Per Plans	Per Title 24	Per Plans/As Built					
Run Period Calendar Year	2009	2009	2009	2009					
Demand Definition	n/a	n/a	DEER Peak	DEER Peak					
Reporting	UTIL-1	UTIL-1	UTIL-1	UTIL-1					

*All internal loads not including lighting

Baseline Modeling Details and Assumptions

Populate the Baseline Modeling Details and Assumptions report with all relevant model inputs used in both the compliance and non-compliance models. Be as specific as possible, ensuring that all system types, equipment loads, lighting loads, artificial loads, envelope constructions, and schedules are supported with appropriate code citations and supplemental documentation.

UTIL-1 Template

Complete the manual inputs on the UTIL-1 tab. The UTIL-1 should automatically calculate the results for your project once the manual inputs are entered.
